## FOCUS AHR EXPO POST-SHOW ISSUE

# Hydronic Products Make a Big Splash

**Cleaver-Brooks** ([www.cleaver-brooks.com](http://www.cleaver-brooks.com)) introduced an addition to its Premier Commercial Boiler line, the Clearfire Model CFV-Steam. The company called the Clearfire-V "the new standard in commercial high-efficiency firetube boilers." Features include full modulation with high turn-down via variable-speed blower, low emissions (under 30 ppm NO<sub>x</sub> and under 10 ppm CO), high efficiency with greenhouse gas reduction, and low-noise operation.

"This new boiler puts us in a market we haven't been in," said Robert Riccio, Cleaver-Brooks regional vice president. "We are very excited about this new technology."

Another new item the company brought to the expo was the Falcon ISD Intelligent Sequencing Device. It is designed for use with the line of Clearfire CFC full-condensing hot-water boilers, but can also be used to sequence and con-

trol pumps, variable-speed drives, dampers, and other equipment.

Victor Cerbins, product manager, commercial boilers, described the ISD's function this way: "What it does is looks at the supply water to come through the loop, the return water temperature in that loop, and also the flow. So with those three variables, you can determine what your demand really is." It can control up to 16 boilers.
